

## Processing Metal Stamping

Yitong® Processing Metal Stamping is a processing method that applies external force to plates, strips, tubes and profiles by punching and die to plastically deform or separate them to obtain the desired shape and size of the workpiece.

## Product Description

We delight in an exceptionally good popularity amongst our customers for our fantastic product high quality, competitive cost as well as ideal service for Professional Design China Processing Metal Stamping, We welcome new and previous buyers from all walks of everyday living to get in touch with us for foreseeable future organization interactions and mutual success!

Professional Design China Processing Metal Stamping, Metal Part, To get more information about us as well as see all our items, remember to visit our website. To get more information remember to feel free to allow us to know. Thank you very much and wish your business always be great!

Yitong® Processing Metal Stamping is a processing method that applies external force to plates, strips, tubes and profiles by punching and die to plastically deform or separate them to obtain the desired shape and size of the workpiece. The stamping process is generally divided into cold stamping and Hot calcination two, hot calcination is generally used less, usually said metal stamping refers to cold punching, cold punching refers to the metal stamping performed at room temperature, cold punch summed up into two categories: forming process and Separation process.

1. The separation process is a stamping in which the sheets are separated by a certain contour to obtain a certain shape, size, and cut surface. Separation process points: blanking, punching, cutting, trimming, etc.
2. The forming process is a stamping in which the blank is plastically deformed without breaking, thereby obtaining a certain shape and size. The forming process is divided into:
